

HG 6209: Language and the Computer (Computational Linguistics with Python)

Week 1: Introduction, Organization, Main Issues

Today's lecture/session

- Introductions and preliminaries
- Administrative matters
- Course overview
 - Why computers & linguistics?
 - What this course is (and what it isn't)
- Getting Started
 - Algorithmic thinking
 - Environment Setup
 - Basics of Version Control
 - Running Python
 - Introduction to GitHub
 - Homework 1

Instructor background

Dr. Hiram Ring

I'm a field linguist with interests in:

- language documentation/description (PhD, NTU 2015)
- linguistic typology and language contact
- historical reconstruction
- natural language processing and machine learning (since 2015)
- SEAsian languages, particularly of the Austroasiatic phylum

I also write/record/perform music (www.hiramring.com)
and maintain a website for classification of implicit motives
(www.implicitmotives.com)

Main fieldwork site

Figure 1: The Austroasiatic languages

Main fieldwork site: Meghalaya, India

Instructor contact

Dr. Hiram Ring

Office: TBA

E-mail: hiram.ring@ntu.edu.sg

Consultation hours: email me for an appointment – either in person, or online

Student Introductions

- Name, linguistic interest
- What background or knowledge do you have concerning programming?
 - Javascript, C/C++, Excel spreadsheets, R, Python etc.
 - Awareness of what programming is used for (algorithms, security, etc..) and related concerns
 - “nothing” is ok
- Why are you taking this course? (What do you hope to gain out of it?)
 - NOT “nothing”

Administrative matters

- Schedule: <https://hg6209-ntu.github.io>
- Continuous Assessment:
 - Homework (autograded) & exploring AI
 - Project 1 (30%)
 - Project 2 (30%)
 - Quiz 1 (15%)
 - Quiz 2 (15%)
 - Participation (10%)
- Extra Credit: You can get 1~5% extra credit by getting a patch accepted to an open source project related to the course (e.g., NLTK). Your total grade cannot go over 100%. Contact me if you're interested.

Continuous Assessment components

- Homework (autograded):
 - gives you practice writing actual code and submitting it
- Exploring AI (starting in Week 2)
 - prompts and readings that help you understand uses and limitations of current systems
- Project 1 (CA1: 30%)
 - Write a Python program that uses text corpora to evaluate or produce a new resource, then write a brief 4-page paper describing the process and findings. [TBD]
- Project 2 (CA2: 30%)
 - Work with a group of 2-3 to develop a new resource or improve on an existing resource, writing a program to process the data. Summarize your process and findings in an 8-page cowritten paper. [TBD]

Continuous Assessment components

- Quiz 1 (CA3a: 15%)
 - Midterm quiz (2hrs) involving a programming challenge with the ability to access online resources.
- Quiz 2 (CA3b: 15%)
 - Final quiz (2hrs) involving a programming challenge with the ability to access online resources.
- Participation (CA4: 10%)

Why use Computers in Linguistics?

- Linguistics without computers is like taking a walk (or a long, hard hike)
 - It can be very pleasant
 - You can see lots of details
 - There is only so much ground you can cover
- Using a software tool is like catching the MRT
 - Very efficient for set routes
 - You have to adapt to it
 - Hard to customize
- Programming is like driving a car
 - It is expensive to start off (you have to learn!)
 - You are free to go where you want to

The Goal of this Course

*To learn ***enough*** about programming to flexibly **analyze** data and then ***do something with it****

- Coding is done in Python
- We will learn techniques and some software libraries particular to computational linguistics
- You will be able to write your own programs by the end
- You will also understand some of the issues surrounding current AI systems
- You will be able to apply these skills to other data-oriented contexts

HG6209 Prerequisites

- A little linguistic knowledge
 - You know what a word is
 - You know what a part of speech is
 - You know what a parse tree is(If you don't know these, you will have to do a little background reading)
- A computer running Windows, Mac OS, or Linux
 - It is possible to learn using school computers, but it will be much harder
- No computational knowledge required
 - You have to be ready to learn
 - If you are a very experienced Python programmer, then you will not learn so much

What HG6209 isn't

- We won't be learning how to build cars
 - this course is the prerequisite for other NLP courses
 - ...but we won't be writing taggers/parsers/applications (yet)
- It is not just an introduction to Python, but rather one motivated by NLP
- It is not very easy, but it is fun

The Three Virtues of a Programmer

- **Laziness:** The quality that makes you go to great effort to reduce overall energy expenditure. It makes you write labor-saving programs that other people will find useful, and document what you wrote so you don't have to answer so many questions about it.
- **Impatience:** The anger you feel when the computer is being lazy. This makes you write programs that don't just react to your needs, but actually anticipate them. Or at least pretend to.
- **Hubris:** The quality that makes you write (and maintain) programs that other people won't want to say bad things about.

Larry Wall, Tom Christiansen, Randal L. Schwartz, and Stephen Potter (1996) Programming Perl 2nd Ed, O'Reilly.

Readings

- Readings will come from a variety of freely available sources (no required textbook)
- You must read the material before class
 - I will assume you have done so
 - Programming is not (just) knowledge but a skill; we should spend our class time practicing that skill

Homework

- Homework will comprise various practice problems aimed at familiarizing you with practical programming skills/tools.
- Some general guidelines:
 - Try to type everything on your own (at least at first), don't just copy/paste. This can be time-consuming initially, but the process will help you to remember the coding elements.
 - Try to understand the logical steps/process so you can apply them to different problems in the future.

AI tools

- On the use of AI tools (such as ChatGPT), this course will adopt NTU's policy on the use of AI tools for coursework:
 - Give proper citations if you use any AI tool
 - 1 identify any generative AI tools used
 - 2 declare how the tools are used in submitted work
- Some additional notes:
 - the tool may give slightly wrong information, requiring extensive debugging
 - you may end up with a working Python program that doesn't produce any output or produces plausible but incorrect output
 - if you don't understand what the code does, this will be pretty clear to me

AI tools example 1: prompt

The screenshot shows a chat application interface. On the left, there is a sidebar with a '+ New chat' button and a search bar containing the text 'write a python pro...'. Below the search bar is a 'Delete all chat' button. The main chat area displays a conversation. The user's message, 'write a python program to translate between words in the nltk swadesh corpus', is shown in a dark bubble with a timestamp of 14:24 and a small avatar icon. The response from 'ChatGPT' is shown in a light blue bubble with a timestamp of 14:24. The response text is as follows:

```
Sure! Here's a Python program that translates words
between languages in the nltk Swadesh corpus:

```python
from nltk.corpus import swadesh
from nltk.translate import AlignedSent, Alignment,
IBMModel1

def translate_word(word, source_lang, target_lang):
 # Get word translations from Swadesh corpus
 word_pairs = swadesh.entries([source_lang,
target_lang])

 # Create aligned sentences for training the translation
 model
 aligned_sents = [AlignedSent(word_pair, word_pair)
for word_pair in word_pairs]
```

At the bottom of the chat area, there is a text input field with the placeholder text 'Enter your message.' and a send button (a right-pointing triangle) to its right.

# AI tools example 1: issues

The screenshot shows a chat application interface. On the left is a sidebar with a 'New chat' button and a search bar containing the text 'write a python pro...'. Below the search bar is a 'Delete all chat' button. The main chat area has a dark background. At the top, a message from 'You' (timestamped 14:24) asks to 'write a python program to translate between words in the nltk swadesh corpus'. Below this, a response from 'ChatGPT' (timestamped 14:24) provides a Python code snippet. The code uses 'nltk.corpus' and 'nltk.translate' to create aligned sentences for training a translation model. The code is as follows:

```
```python
from nltk.corpus import swadesh
from nltk.translate import AlignedSent, Alignment,
IBMModel1

def translate_word(word, source_lang, target_lang):
    # Get word translations from Swadesh corpus
    word_pairs = swadesh.entries([source_lang,
    target_lang])

    # Create aligned sentences for training the translation
    model
    aligned_sents = [AlignedSent(word_pair, word_pair)
    for word_pair in word_pairs]
```

At the bottom of the chat area is an input field with the placeholder text 'Enter your message.' and a send button (a right-pointing triangle) to its right.

AI tools example 2: prompt

The screenshot shows a chat application interface. On the left is a sidebar with a '+ New chat' button and a search bar containing 'write a python pro...'. Below the search bar is a 'Delete all chat' button. The main chat area has a dark background. At the top right, a message from 'You' is shown with a timestamp of 14:42. The message text is: 'write a python program that uses the nltk swadesh corpus to find word pair equivalents between languages'. To the right of this message is a small cartoon avatar of a person with a lightbulb above their head. Below the user's message is a response from 'ChatGPT' with a timestamp of 14:42. The response text is: '! Here's a Python program that uses the NLTK Swadesh corpus to find word pair equivalents between languages: ```python import nltk # Load the Swadesh corpus nltk.download('toolbox') nltk.download('swadesh') from nltk.corpus import swadesh def find_word_pairs(language1, language2): """ Find word pair equivalents between two languages using the Swadesh corpus. """ # Get the word lists for the two languages word_list1 = swadesh.words(language1) word_list2 = swadesh.words(language2) # Find word pair equivalents word_pairs = [] for word1, word2 in zip(word_list1, word_list2): word_pairs.append((word1, word2)) return word_pairs # Example usage language1 = 'eng' # English language2 = 'fra' # French word_pairs = find_word_pairs(language1, language2) print(f"Word pair equivalents between'. At the bottom of the chat area is a text input field with the placeholder 'Enter your message.' and a send button with a right-pointing arrow.

You 14:42

write a python program that uses the nltk swadesh corpus to find word pair equivalents between languages

ChatGPT 14:42

! Here's a Python program that uses the NLTK Swadesh corpus to find word pair equivalents between languages: ```python import nltk # Load the Swadesh corpus nltk.download('toolbox') nltk.download('swadesh') from nltk.corpus import swadesh def find_word_pairs(language1, language2): """ Find word pair equivalents between two languages using the Swadesh corpus. """ # Get the word lists for the two languages word_list1 = swadesh.words(language1) word_list2 = swadesh.words(language2) # Find word pair equivalents word_pairs = [] for word1, word2 in zip(word_list1, word_list2): word_pairs.append((word1, word2)) return word_pairs # Example usage language1 = 'eng' # English language2 = 'fra' # French word_pairs = find_word_pairs(language1, language2) print(f"Word pair equivalents between

Enter your message.

```

AI tools: notes

There are lots of issues with current AI systems. For an accessible introduction to the many concerns, this Scientific American article is a good start:

- AI Causes Real Harm. Let's Focus on That over the End-of-Humanity Hype

Algorithmic Thinking

- Exercise: How to make kaya toast
- Also see: <http://www.cookingforengineers.com/>
